

Is it practical to implement NGS technologies in NCPDN labs for virus detection

Dimitre Mollov

USDA ARS National Germplasm Resources Laboratory

What is NGS and how does it work?

Next Generation Sequencing Technology

- Routine detection of viruses and other pathogens
- Extremely sensitive
- Highly reliable
- Identify unknown or poorly characterized viruses
- Whole genomes sequencing (most feasible approach)
 - Pathogen diversity; mutations; new strains
 - Ability to improve detection techniques

Template immobilization

NGS platforms

- 454
- Illumina
- SOLiD
- Polonator
- Helicos

Metzker, 2010

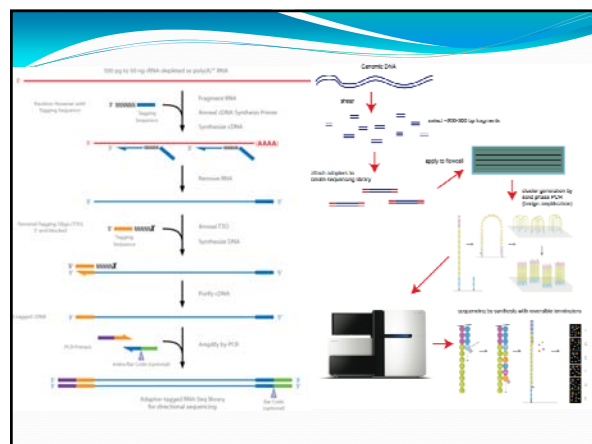

NGS target

- Total RNA (or mRNA) or DNA
- siRNA
- dsRNA
- Virion Nucleic Acid

Materials and methods

RNA
Extraction

NGS data

- *De novo* assembly
- NCBI database
 - Nucleotide
 - Protein
- E-probes
 - EDNA
 - Custom database
 - Nucleotide
 - Protein
- Mapping
 - Raw reads
 - Contigs

Materials and methods

Data analysis

Lab
conformation

Workflow

Sequence reads	Millions
Contig assembly	CLC Workbench
BLAST	NCBI Local database; BLASTN, BLASTX
Viral contigs	Computer vs. biology
Lab validation	PCR, Sequence
Map to reads	Final assembly

Sequence reads

25-50 million reads per sample,
~5-10% removed due to low quality
Length of reads: ~100 (<50-600)

Contig assembly

<100,000 to >750,000 contigs per sample
Why so many?

Not all are useful: 500-10,000 nt long =>
10-20,000 contigs

NCBI Local database; BLASTN, BLASTX

I appreciate your dedication,
but genome browsers just aren't
really designed for phones.

Sequence reads and contigs

Virus related contigs: 0 to >100
Plant virus related contigs

How about uncharacterized viruses

Computer vs. biology

I don't care if it is all bioinformatics. I'm a *biologist*, I'm *doing*
an experiment, so I'm wearing my safety glasses!

Lab validation

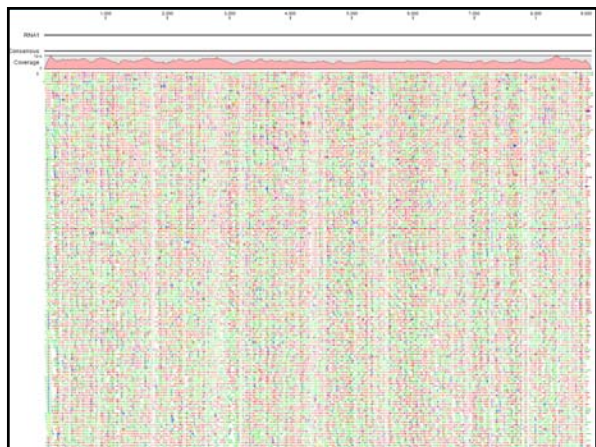

Infected Healthy

PCR, Sequence

Sequence reads mapping

	Sample 1		Sample 2		Healthy control
	number	percent	number	percent	
RNA1	373,519	0.96	340,701	0.91	26
RNA2	952,707	2.44	870,223	2.31	66
RNA3	309,844	0.79	285,005	0.76	11

Do I see NCPDN using NGS?

- RNA extraction
- DNase treatment ~\$50
- rRNA depletion ~\$100
- Library preparation ~\$100-200
- Sequence run ~200
- Total cost ~\$525-650 per sample
- Bioinformatics support
- Lab validation – PCR and Sequence

Next Generation Sequencing Technology: Why do it?

- Routine detection of viruses and other pathogens
- Extremely sensitive
- Highly reliable
